

Professor Ed Gallagher

23 July 2008

**Can Road Transport contribute to
Climate Change Targets?**

**Can Biofuels contribute to
Climate Change Targets
SUSTAINABLY?**

A past consensus
A present controversy

Biofuels contribute to rising food prices

**Greenhouse Gas Savings are lower than
previously thought**

**Target idle and marginal land;
residues and waste**

Incentives for advanced technologies

Slowdown in growth of Biofuels

but

Sufficient land is available

A sustainable industry is possible

Using the right

- **Feedstocks**
- **Production processes**
- **Co-products**
- **Land**
- **New technologies**

How do we ensure they are used?

- **Agreements**
- **Regulations**
- **Markets**
- **Incentives**

What effect will this have?

- **1% of global emissions**
- **Global food prices will increase**
- **Fuel prices may increase**
- **Protection for the poor will be needed**

Conclusions

- **More caution and discrimination are needed**
- **Biofuels have a part to play in a low carbon transport future**
- **A new consensus is needed for a sustainable industry**
- **The public need information to make choices**

Thank you
