Consumers, Vehicles and Energy Integration (CVEI) Project:

Achieving the benefits of integrating vehicles into the energy supply system

Low Carbon Vehicle Partnership Annual Conference, 30th June 2016

Nick Eraut – Project Manager, ETI

Challenges for low carbon vehicles

- Meeting user energy supply requirements, whilst managing energy capacity constraints
- Implementing intelligent vehicle charging without compromising vehicle / battery utility
- Developing greater understanding as to where and to what extent to invest in network reinforcement
- Integrating liquid and electric “fuel” supply systems for vehicles, and utilising the capability of the liquid fuel system

A report by the Energy Technologies Institute

Transport

An affordable transition to sustainable and secure energy for light vehicles in the UK

Plugging vehicles in and charging them

Journey arrival times (2007-2010) and Electricity demand profile (7th December 2010)

Compiled using NTS and UKERC data

Network reinforcement costs

Consumers, Vehicles and Energy Integration Project

Project aim:

- to address the challenges involved in transitioning to a secure and sustainable low carbon vehicle fleet
- to examine how tighter *integration* of vehicles with the energy supply system can benefit:
 - vehicle users
 - vehicle manufacturers
 - organisations throughout the energy supply chain

The outputs will:

- help inform UK government (and European?) policy
- help shape energy and automotive industry products

Project overview

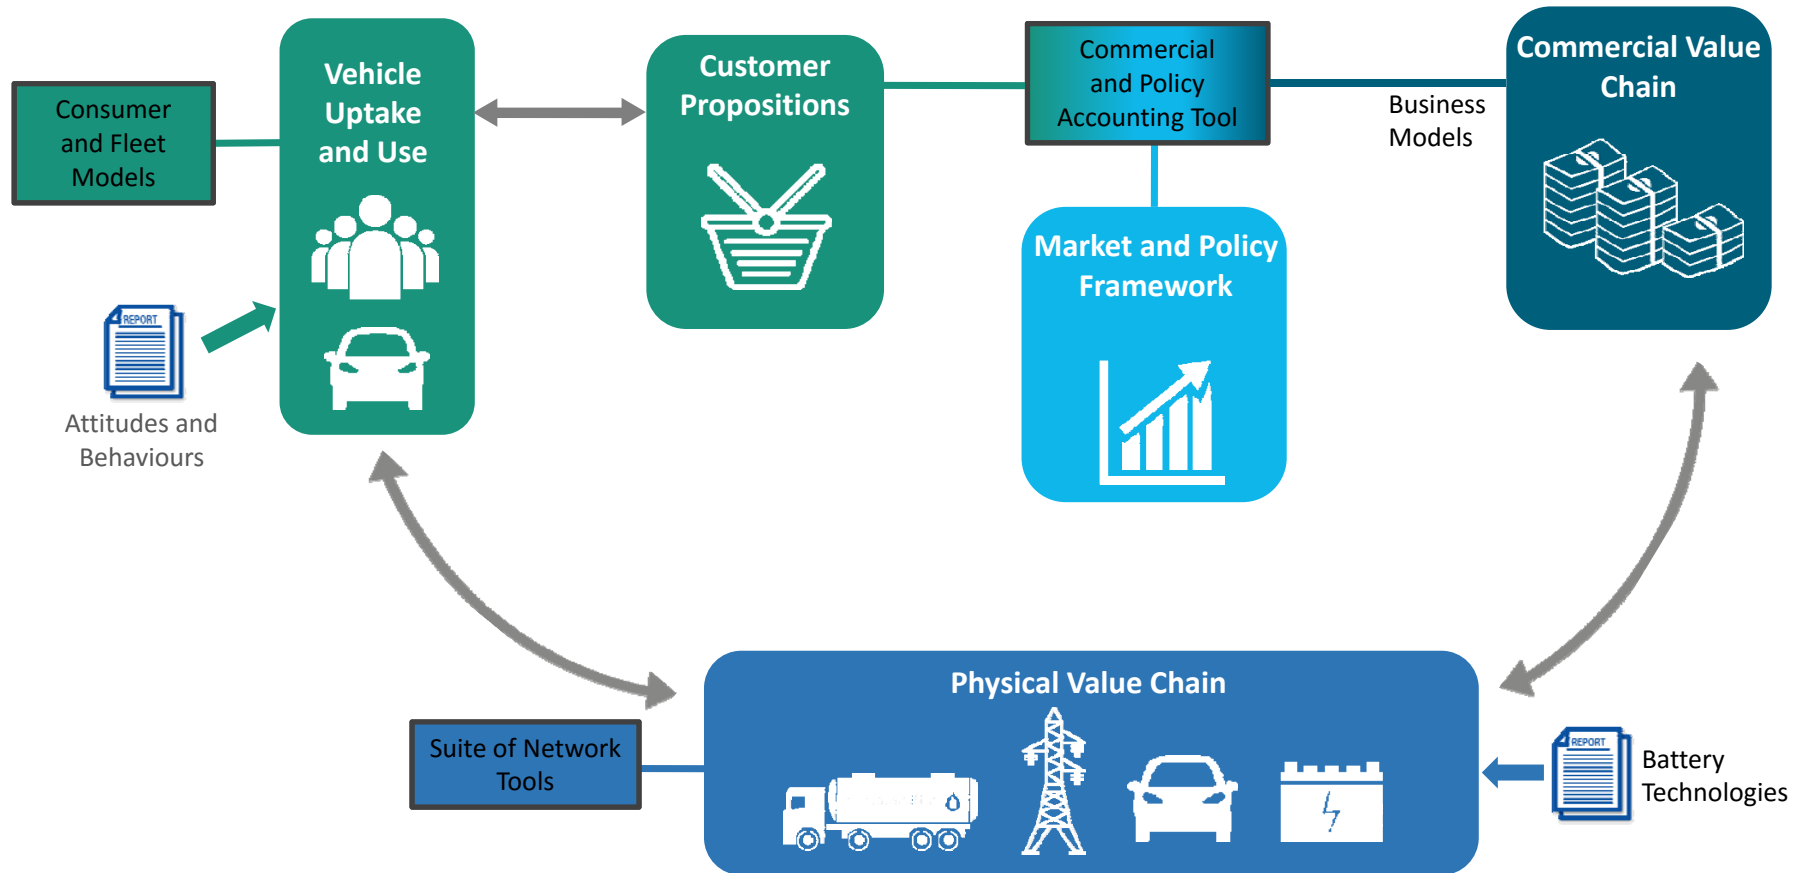

- ETI investment of £5 million over two years
- Stage 1: detailed design & analysis to characterise:
 - market, policy and regulatory frameworks
 - business models and customer offerings
 - integrated vehicle and infrastructure systems and technologies for electricity and liquid fuel / hydrogen
 - consumer and fleet attitudes to adoption and usage behaviours
- Stage 2: trial with mass-market consumers, and a corresponding fleet study:
 - to test and validate solutions and assess responses

The project team

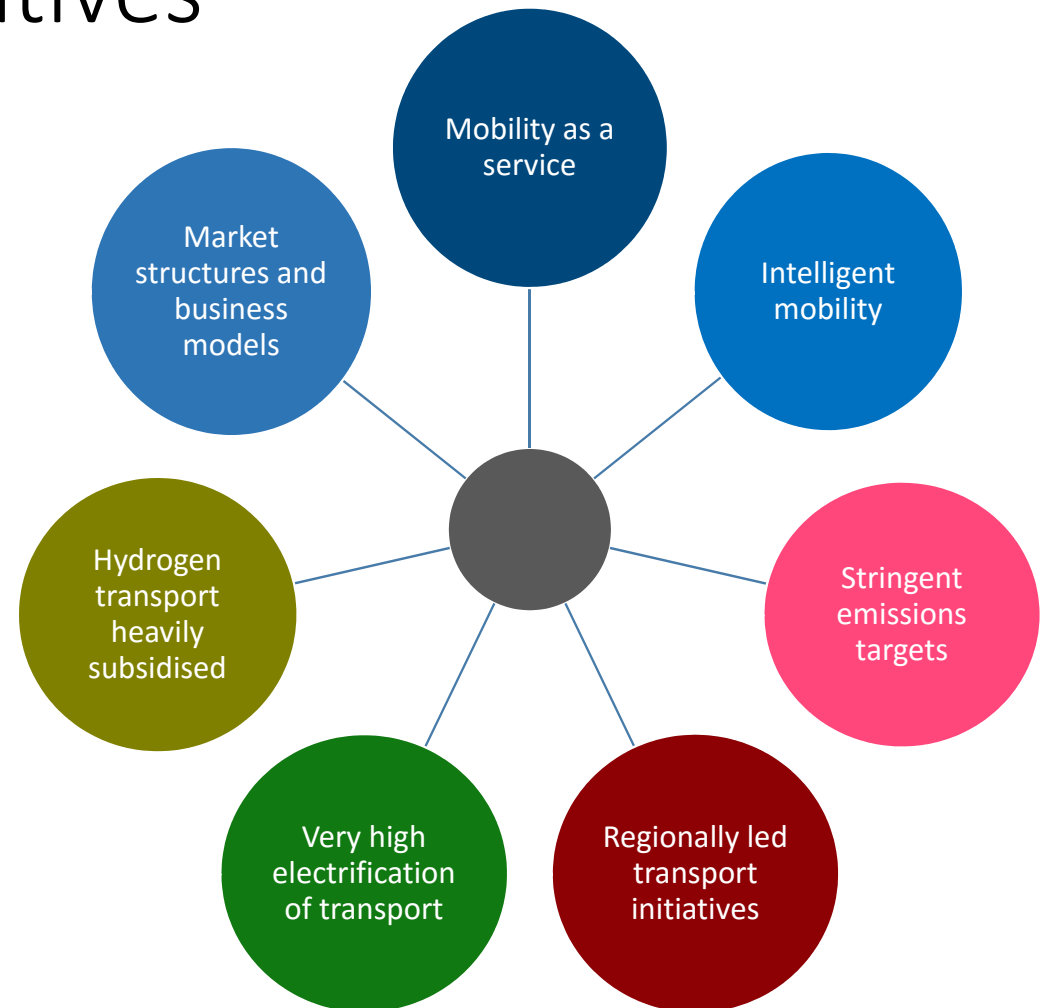

Modelling framework (overview)

Development of narratives

- Various “narratives” (scenarios) defined to describe aspects of possible future environments for ULEV deployment and use.
- These are used to “stress test” the effectiveness and robustness of solutions in different futures.
- Each narrative comprises many “building blocks” characterising key aspects of:
 - customer proposition,
 - market & policy framework,
 - physical value chain, and
 - commercial value chain.
- Example factors addressed by the range of narratives are shown here ...

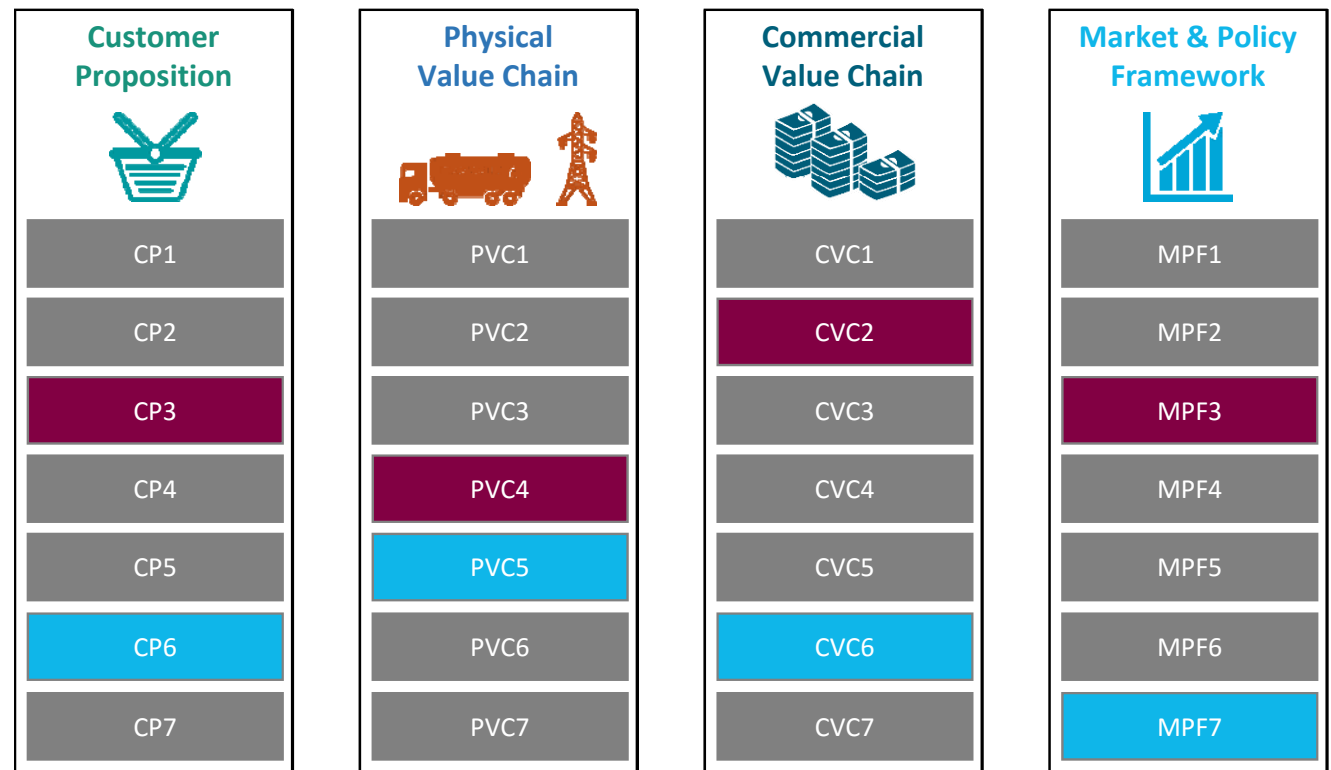

Narratives comprising building blocks

Each narrative comprises many “building blocks” characterising key aspects of:

- customer proposition,
- market & policy framework,
- physical value chain, and
- commercial value chain.

“Transport on Demand” narrative

“Hydrogen Push” narrative

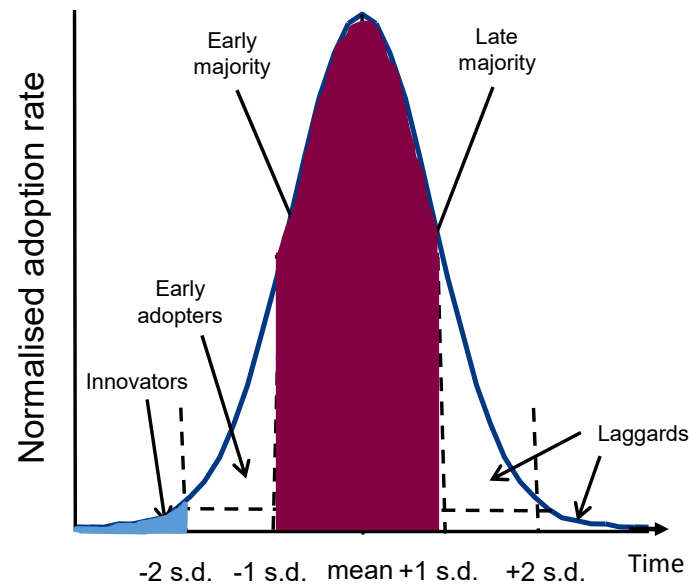

Purpose of Stage 2

- Trial with mass-market users ...
- to deliver learning, testing and, so far as possible, validation of ...
- the expected impacts of the system solutions and offerings identified in Stage 1 ...
- on vehicle users, fleet operators, emissions, market behaviour, system resilience and cost.

Consumer adoption model and “mass-market” consumers

Early stages of adoption

- Users with access to EVs are still classed as ‘Innovators’ (i.e. very early stage of adoption)
- To date, trials have been conducted using only Innovators
- Low numbers of consumers
- Attitudes and behaviours are not representative of the majority of users

Future majority ‘Mass-market’ consumers

- Much larger numbers of users
- These will significantly influence the energy system
- Very different motivations, attitudes and behaviours to those of Innovators
- Unlikely currently to use or own a plug-in vehicle
- Do not generally have specific motivations for early adoption of plug-in vehicles
- Less likely to adapt behaviour (e.g. to accept managed charging) to meet needs of the vehicle or energy system

Unique value of this trial

- Trial with **mass-market users**
 - i.e. people from the majority of the vehicle user and fleet operator market
- Addressing **widely-applicable plug-in vehicles** (BEVs and PHEVs)
 - suitable for wide range of users
- **Holistic system** design

Key components of Stage 2*

<p>Consumer – Vehicle Uptake Trial</p> <p>➤ to enhance understanding of adoption of EVs</p> <ul style="list-style-type: none">• 200 consumers, given 2 days with each of 3 vehicles in turn (BEV, PHEV, ICE)• additional questionnaires and choice experiments (with reduced ‘psychological distance’)• findings inform analysis on uptake by mainstream consumers under different market and policy frameworks	<p>Consumer – Charging Behaviour Trial</p> <p>➤ to assess response to market frameworks and policy incentives for demand management</p> <ul style="list-style-type: none">• 240 consumers, given 2 months with a vehicle• parallel BEV and PHEV trials• data on use and charging / fuelling, with additional questionnaires and choice experiments• findings inform analysis of effectiveness of charging solutions and vehicle-energy integration and of system level impacts
<p>Fleet – Uptake and Managed Energy Supply Study</p> <p>➤ to assess informed response to modelled fleet-wide roll-out</p> <ul style="list-style-type: none">• case studies with selected fleets based on analysis in Stage 1• some vehicles replaced by ULEVs to provide real experience• wider fleet roll-out modelled and assessed with operators	<p>Update of Results, Reporting and Dissemination</p> <p>➤ to complete analysis and communicate results</p> <ul style="list-style-type: none">• capture learning, update frameworks, assumptions, uncertainties and analysis• derive conclusions re uptake and integration of vehicles into system• reporting and dissemination

* All details are provisional, subject to detailed trial design to be completed during Stage 1

Key take-home messages today

- There are substantial **challenges** associated with widespread roll-out of low carbon vehicles, but a paradigm shift from a *“problem for the network”* to an *“opportunity through integration of vehicles as part of a wider system”* can yield **benefits for all actors in the system**:
 - including increased uptake of low-emission vehicles, managing charging and refuelling, and optimising the system design.
- Analysis and solutions must be **holistic** (considering all parts of the system together, including users).
- CVEI Project will determine and characterise **good system solutions**.
- Robust trial in Stage 2 will generate additional data to test solutions and inform analysis, and will add **unique value** (though use of PHEVs and mass-market consumers in particular).
- Expect to communicate **initial results soon**:
 - Stage 1 in Sept (at Cenex LCV2016, SMMT, other stakeholder groups, publication of reports, etc)
 - Stage 2 next year.

Stage 1 Work Packages

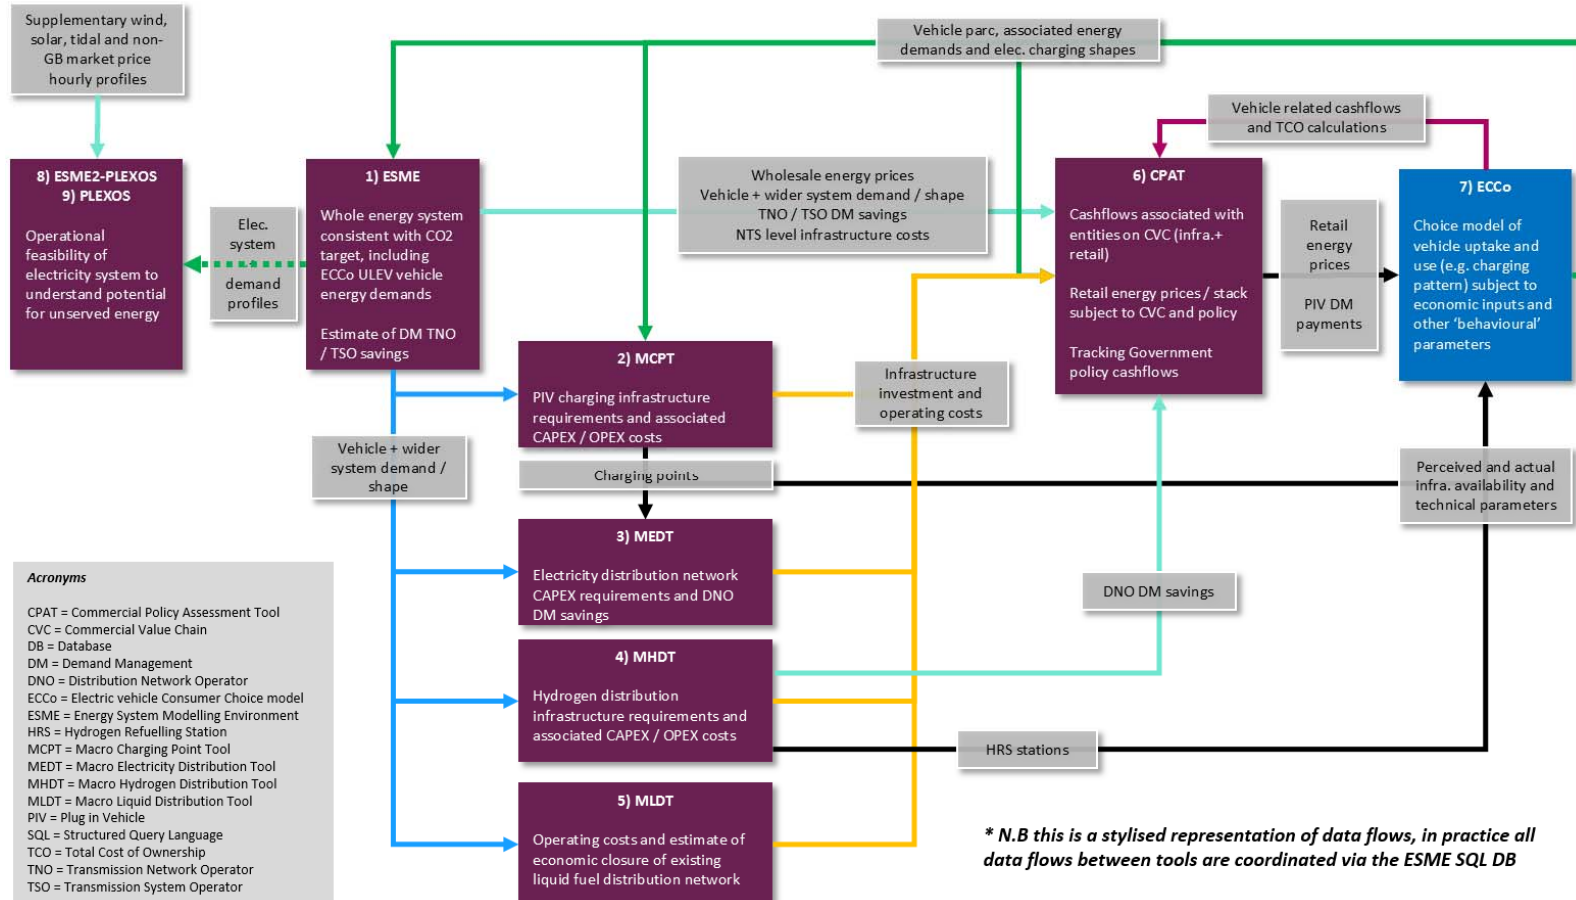

Modelling framework (overview)

Modelling framework

Modelling framework

* N.B this is a stylised representation of data flows, in practice all data flows between tools are coordinated via the ESME SQL DB

** Primary iterative loop across the tools covers steps 1)-7), steps 8)-9) performed on 'equilibrium' solution

Narratives

Organic action

Coordinated action

OEM innovation

Vehicle OEMs make ULEVs attractive to consumers

Physical

- ▶ Home charging

ANM / manual DSR / fast charging

Commercial

- ▶ OEM led integration

Smart cars

Customer

- ▶ Vehicle purchase; ToU charging

BaU +

Policy

- ▶ Push away from fossil fuels

Market driven

ULEV enabled

- ▶ Expanded below

Hydrogen push

- ▶ Expanded below

City led

Regional push for cars in cities part of integrated transport

Physical

- ▶ Depot charging

Depot charging

Commercial

- ▶ Multi modal integration

Final mile

Customer

- ▶ Vehicle rental

Opt-in sharing

Policy

- ▶ More regional perks

Regionally led

Transport on demand

Transport as a service

Physical

- ▶ More fast, novel charging

On demand

Commercial

- ▶ Bundled services

On demand

Customer

- ▶ Rental of shared vehicles

On demand

Policy

- ▶ Supply chain focussed

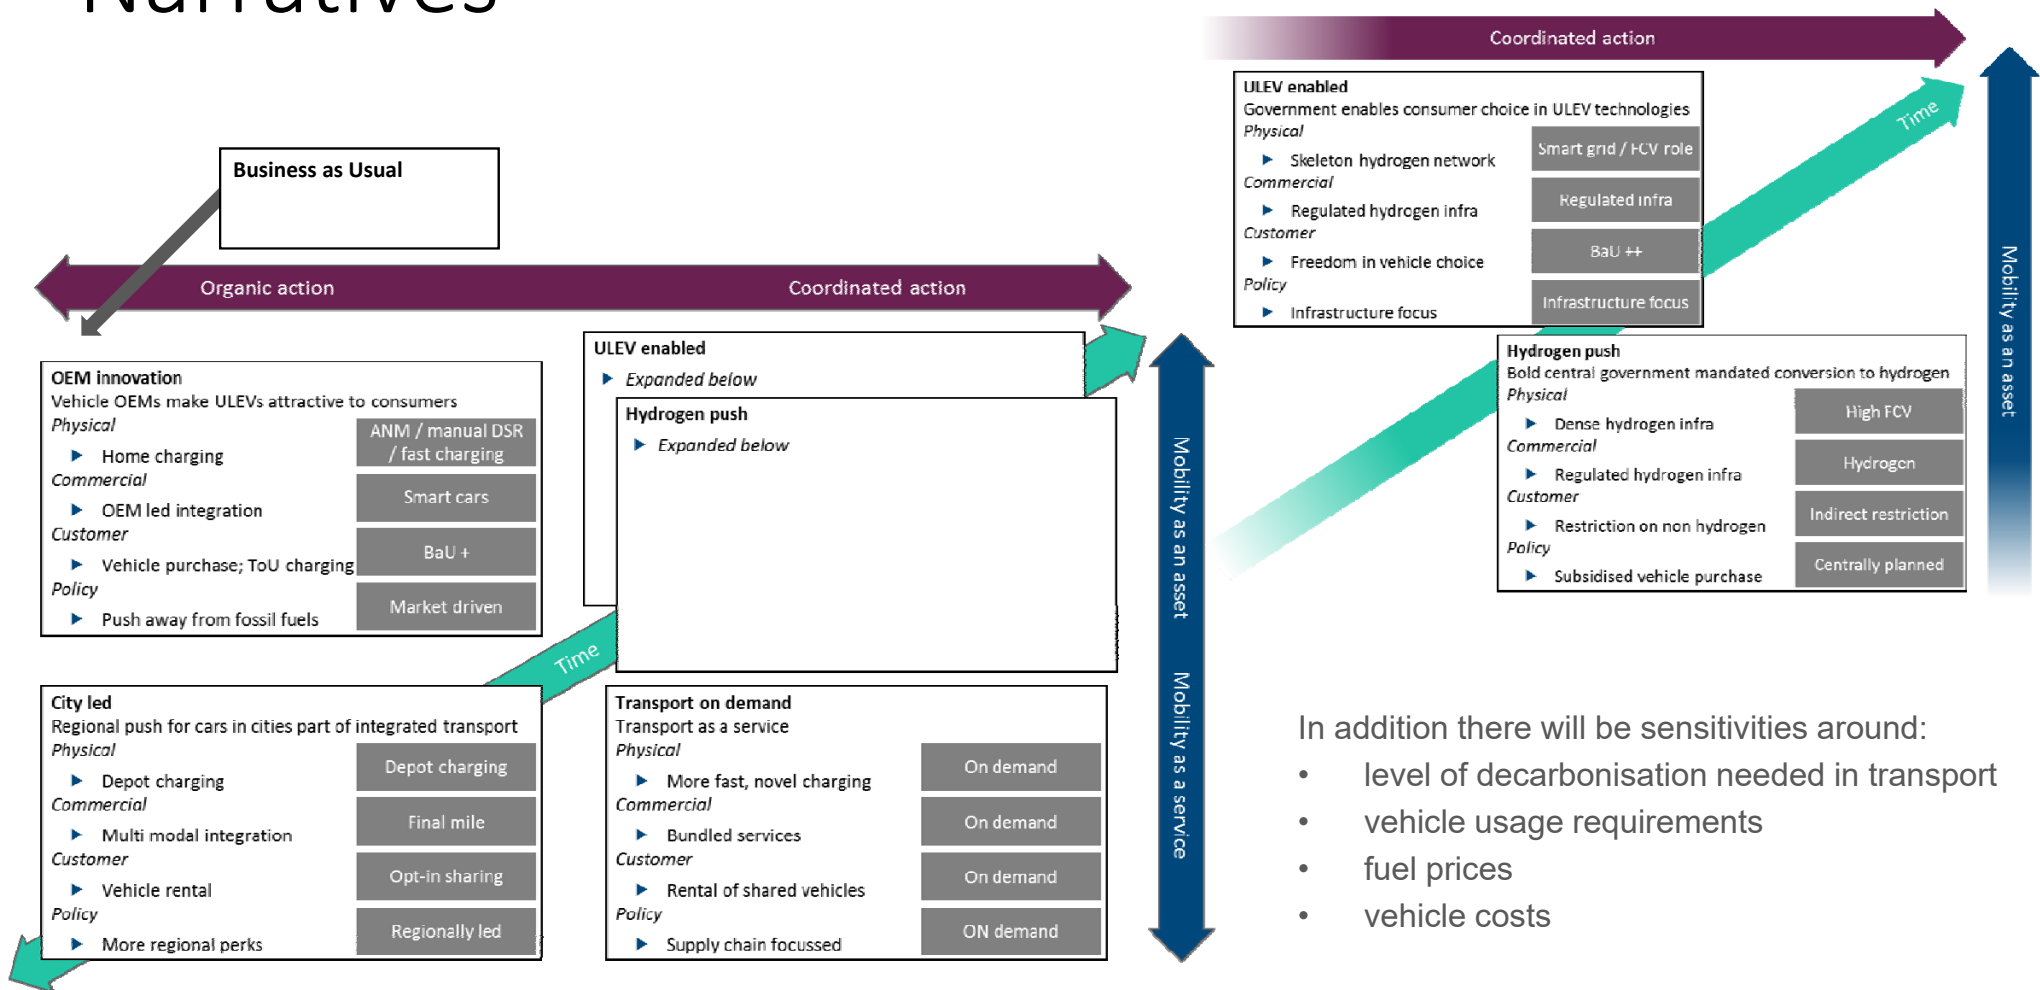

ON demand

Time

Mobility as an asset

Mobility as a service

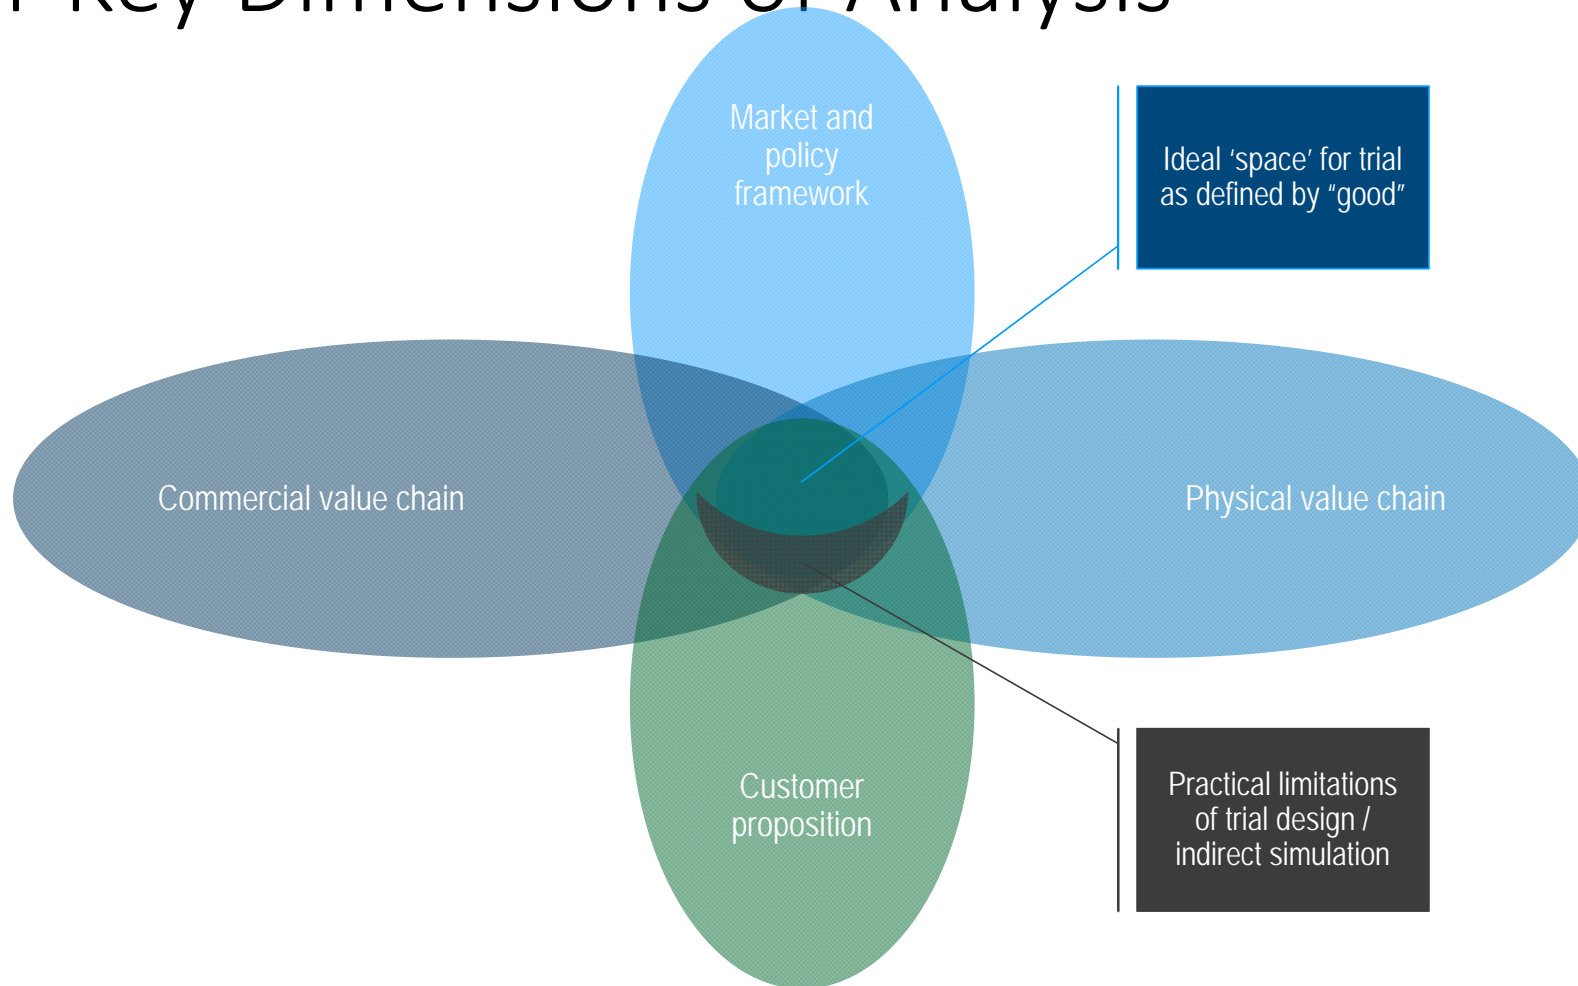

Narratives

In addition there will be sensitivities around:

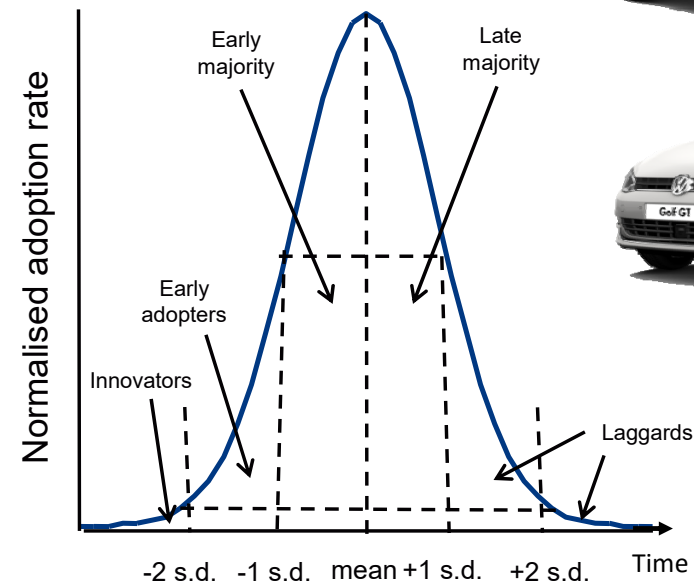

- level of decarbonisation needed in transport
- vehicle usage requirements
- fuel prices
- vehicle costs

Four Key Dimensions of Analysis

Consumer vehicle uptake trial

- Will use three different types of vehicle:
 - a Battery Electric Vehicle (BEV)
 - a Plug-in Hybrid Electric Vehicle (PHEV)
 - an Internal Combustion Engine (ICE) vehicle
- VW Golf
 - Based on existing popular C-segment car and is a top 5 selling car in the UK
 - Identical models of BEV, PHEV and ICE available
- Consumers will be given up to 2 days with each of the 3 vehicles in turn (the order they receive the vehicles will be randomised)
- Having experienced each of the vehicles, participants will be interviewed and take part in choice experiments to deduce attitudes to the different vehicles
- Findings will be fed into ECCo model to inform analysis on uptake of each type of vehicle by mainstream consumers under different market and policy frameworks

Consumer charging behaviour trial

- Will comprise 2 trials
 - BEV (VW e-Golf) – electric range 118 miles (24.2kWh)
 - PHEV (VW Golf GTE) – electric range 31 miles (8.7kWh)
- Each with 3 test conditions
 - Managed charging – charging will be managed (e.g. by supplier) to minimise charging costs
 - Time of Use tariff – set prices will be offered at different periods during the day to encourage users to charge at certain times
 - Control condition – will charge the vehicle without supplier management or variable pricing
- Participants will be allocated one of the vehicles and will have 8 weeks use of it under one of the 3 conditions
- Trial will measure:
 - Mileage
 - Plug-in and plug-out times
 - Charge times
 - Battery state of charge
- Post-trial interviews and choice experiments will extend the learning around effectiveness of the different options
- Results from the trial and the follow-up will feed into the analysis of the effectiveness of the charging solutions and vehicle-energy integration and system level impacts

Carbon emissions

	SAE level	Name	Steering, acceleration, deceleration	Monitoring Driving Environment	Fallback Performance of Dynamic Driving Task	System Capability (Driving Modes)	Timeline
Human monitors environment	0	No automation The full-time performance by the <i>human driver</i> of all aspects of the <i>dynamic driving task</i> , even when enhanced by warning or intervention systems				n/a	Now
	1	Driver assistance The <i>driving mode</i> -specific execution by a driver assistance system of either steering or acceleration/deceleration using information about the driving environment and with the expectation that the <i>human driver</i> perform all remaining aspects of the <i>dynamic driving task</i>				Some driving modes	Now
	2	Partial automation The <i>driving mode</i> -specific execution by one or more driver assistance systems of both steering and acceleration/deceleration using information about the driving environment and with the expectation that the <i>human driver</i> perform all remaining aspects of the <i>dynamic driving task</i>				Some driving modes	Now
Car monitors environment	3	Conditional automation The <i>driving mode</i> -specific performance by an <i>automated driving system</i> of all aspects of the dynamic driving task with the expectation that the <i>human driver</i> will respond appropriately to a <i>request to intervene</i>				Some driving modes	2017
	4	High automation The <i>driving mode</i> -specific performance by an <i>automated driving system</i> of all aspects of the <i>dynamic driving task</i> , even if a <i>human driver</i> does not respond appropriately to a <i>request to intervene</i>				Some driving modes	2025
	5	Full automation The full-time performance by an <i>automated driving system</i> of all aspects of the <i>dynamic driving task</i> under all roadway and environmental conditions that can be managed by a <i>human driver</i>				All driving modes	2025
